**Keywords:** SPF, red pigment; natural extract; organic UV filter; secang, zno, sunscreen.

**Abstract:** Sunlight consists of ultraviolet (UV) light and organic Ultraviolet (UV) filters can be found in plants and fruits which have orange-red or pink colors, such as watermelon, tomato, Secang (*Caesalpinia sappan*), carrot, dragon fruit, faloak (*Sterculia quadrifida* R.Br), strawberry, papaya, and rosella. Most of these plants contain active compounds such as carotenoids and anthocyanin. Determination of the effectiveness of the extracts as potential sunscreen was carried out by determining the Sun Protecting Factor (SPF) value *in vitro* by UV spectrophotometry. Maceration technique was used for the extraction process by using ethanol with a ratio of 4:1. Each of dried extract (100 mg) was then mixed well in the ethanol (96%, 50 mL) until all the extract was dissolved and then filtered. The SPF values were determined by the Equation of Mansur. It was observed that all of the red pigmented extracts showed UV protection capabilities, with Secang extract gave the highest SPF value of 18.490. The Secang extract would have good potential to be developed as one of the ingredients in the sunscreen cream. Sunscreen cream combination between Secang extract and ZnO showed good quality and significant SPF value than ZnO and extract Secang sunscreen cream.

## 1 INTRODUCTION

Indonesia is a country with a tropical climate so that it gets more sunlight intensity than other countries. Sunlight, called ultraviolet (UV) light based on its wavelength, is divided into UVA, UVB and UVC. UVA has the longest wave of 320-400 nm and causes skin cancer in the epidermal layer, UVB with a wavelength of 290-320 nm gives an effect on the epidermis and dermis layer causing the skin to burn and UVC with the shortest wavelength 180-280 nm (Manuaba, 2010). UVC and most of the UVB radiation is absorbed by the ozone layer in the earth's atmosphere, therefore UVA accounts for 95% of UV radiation to the earth's surface which affects the entire organism. UVA is a major cause of skin injury and disease in humans, also indirectly affects DNA / RNA damage (Zhong et al., 2011).

Sunscreens initially developed to prevent sunburn and have evolved to protect against other harmful effects of ultraviolet radiation (UVR). UVB (280-320

nm) typically induces erythema and direct DNA damage via pyrimidine dimer formation, whereas UVA (320-400 nm) is associated with tanning and photo aging. (R, BA and MD, 2011). Sunscreens can absorb at least 85% of the sun's rays at a wavelength of 290-320 nm for UVB but can continue to light at wavelengths of more than 320 nm for UVA (Amnuakit and Boonme, 2013).

Sunscreen products consist of several chemicals that can absorb UV radiation or commonly called UV filters or UV light retaining. UV filter is an individual compound or mixture that is useful to prevent UV light from passing through it. Based on its function, the active ingredient of sunscreen is divided into two, namely absorbing compound as an absorbent of UVB rays to filter incoming light, for example Octyl dimethyl PABA, Octylmethoxycinnamate, Octocrylene, tinosorb and reflecting compounds which mechanism inhibit the absorption of UVA rays, for example TiO<sub>2</sub> and ZnO (Agustin, Oktadefitri and Lucida, 2013). Semiconductor TiO<sub>2</sub>

is used as an inorganic UV filter for sunscreens. TiO<sub>2</sub> is used as a filter on sunscreen because it is widely used as an agent to absorb or spread UV radiation and has many characteristics that can be described, including long-term topical use such as cream, broad spectrum absorption, high photo stability, and low irritation (Ko et al., 2012). In addition, TiO<sub>2</sub> has a deficiency if applied to the skin leaving white and opaque marks and inducing free radical formation under light exposure. This is an initial research of sunscreen formulations made by combining organic and inorganic solar filters because inorganic filters can block UVA radiation and most organic filters protect from UVB radiation (Reinosa et al., 2016).

Inorganic filters work by filtering or blocking UV light throughout the UVA and UVB ranges at 290-400 nm waves through absorption, scattering and reflection (Serpone, Dondi and Albini, 2007). While the organic filter in the results of Jacek and Katarzyna's research in 2014 (Arct and Pytkowska, 2014) has the property of penetrating the skin, affecting the body's hormones, having photochemical activities and reactions that occur in infected skin.

A study conducted by (Suwarni and Suprijono, 2014) about making creams from natural ingredients using extracts of ant nests with carica fruit (mountain papaya) that these two ingredients can improve the stability of the preparation with the formation of physical characteristics and good SPF values. Another study showed that ethanolic bark extract of *Prosopis cineraria* which is an excellent source of natural flavonoids and polyphenols showed decrease in skin melanin, erythema and sebum contents by the application of the formulation by in vivo method (Mohammad et al., 2018).

Organic UV filters are found in plants and fruits that are orange-red or pink, such as tomatoes, watermelons, dragon fruit, papaya, carrots, rosella, faloak, Secang and strawberries. Most of these plants contain active compounds such as carotenoids and anthocyanins. Carotenoids are known as compounds that have antioxidant activity because they have conjugated double bonds. Carotenoids such as  $\beta$ -carotene or lycopene are efficient antioxidants in binding of oxygen singlet molecules and peroxy radicals produced during the photo oxidation process (Prasiddha et al., 2016). The anthocyanin group is a natural pigment with a red range that is abundant in flowers, this pigment is able to fight the oxidation process in the body (Zafra-Stone et al., 2007). Natural pigments from several types of plants can disguise and even cover the white marks caused by the use of TiO<sub>2</sub> as an inorganic UV filter. In one study entitled Determined by In Vitro Method "Effect of The

Organic and Inorganic Filters on The Sun Protection Factor" shows a synergistic effect when TiO<sub>2</sub> is combined with anisotriazine or PABA octyl dimethyl. The combination of ZnO and organic filter also had the same synergistic effect (El-Boury et al., 2007). Therefore, this research was conducted to determine if ZnO has synergistic effect when combine with red pigmented extract plant in enhancing the SPF value.

## 2 METHODS

Materials used were Ethanol p.a. (Sigma), Ethanol 96%, Watermelon, Tomato, Secang, Carrot, Dragon Fruit, Strawberry, Papapaya, Rosella, and Faloak, ZnO, IKA Rotary Evaporator, Spectrophotometer UV-Vis (Jasco)

Ethanol extraction were obtained from maceration with ratio 1:4 in ethanol 96%. Filtrat was then evaporate using rotary evaporator and dried. Determination of the effectiveness of the potential sunscreen extract was carried out by determining the SPF value in vitro by UV-Vis spectrophotometry. The extracts of each ingredient were weighed as much as 100 mg, 50 ml of 96% ethanol was added and shaken until homogeneous then filtered. Ethanol 96% was used as blank. The absorbance were measured, with wavelengths between 290-320 nm. Then the average absorption ( $A_r$ ) is set at 5 nm intervals. The results of the absorbance of each concentration are recorded and then the SPF value is calculated by the Equation of Mansur.

$$SPF = CF \sum_{290}^{320} EE(\lambda) I(\lambda) Abs(\lambda) \quad (1)$$

CF = Correction Factor (10)

EE( $\lambda$ ) = Erythema Effect Spectrum

I( $\lambda$ ) = Intensity of UV

Abs( $\lambda$ ) = Absorbance of Extract

Whereas EE( $\lambda$ ) x I( $\lambda$ ) value is a constant (Malsawmtluangi et al., 2013) shown in table 1.

Table 1: EE( $\lambda$ ) x I( $\lambda$ ) values in mansur equation (Dutra et al., 2004).

Wavelength (nm)	EE( $\lambda$ ) x I( $\lambda$ )
290	0,0150
295	0,0817
300	0,2874
305	0,3278
310	0,1864

### 3 RESULTS AND DISCUSSION

The results of the statistical analysis showed that extracts from the nine plants differs significantly (Sig. 0.000) between extract groups. As can be seen in Table 3, Secang showed the largest SPF results that were significantly different from all of the herbal groups, which amounted to 18,490. The effectiveness of sunscreen is usually stated with SPF (Sun Protecting Factor) which is a comparison of the UV energy needed to make a minimum of erythema effect on protected and unprotected skin.

Table 3: SPF values of different red pigmented herbal extracts.

Herbal Extracts	SPF Value
Watermelon	8.889±0.198
Tomato	5.764±1.062
Secang	18.490±1.116
Carrot	4.933±0.543
Dragon Fruit	5.220±0.713
Faloak	15.842±0.373
Strawberry	14.437±0.215
Papaya	10.221±0.569
Rosella	12.973±0.875

Table 4: Absorbance of watermelon, tomato, secang, carrot, dragon fruit, faloak, strawberry, papaya, and rosella extract.

SPF Value	19.68 ± 0.024	19.38 ± 0.95	15.83 ± 0.07

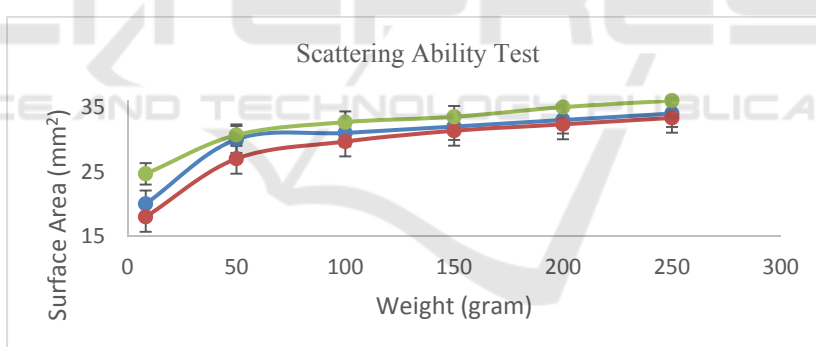

Figure 2: Scattering ability test diagram.

Some herbal extracts have SPF values that do not differ significantly from one another, which are watermelon, strawberry and papaya extract, show a range between 8,889 to 14,437 and another group that are not significant is tomato, carrot and dragon extract with a range of 4,933 to 5,764. It is known that Secang extract has the highest SPF value, this is supported by the red pigment from Secang extract which is more concentrated than the red pigment obtained from other extracts. Secang extract contains Brazilian compounds in which these compounds is the characteristic compound of Secang. Brazilian have several functions and one of them is antioxidants. As

the previous study, it is suggested that plant extracts acted by capturing ROS, thus minimizing erythema and collaborating indirectly to in vivo SPF enhancement (Cristina *et al.*, 2016).

Therefore, Secang extract could potentially formulated as sunscreen and could give synergistically effect of reducing the white effect of inorganic active substances and at the same time has antioxidant benefits for the skin in order to counteract free radicals due to induction of UV light exposure.

## 4 CONCLUSIONS

SPF is a standard that has been used throughout the world as a measure of the effectiveness of sunscreens. Some of these herbal extracts have SPF capabilities. The SPF value of several herbal extracts which have red pigment with Mansur equation shows the variation in the range between 4.933 to 18.490 and the herbal extract which has the highest SPF value is Secang extract. The Secang extract has the potential to be developed into a natural pigment-based sunscreen preparation formulation or to be combined with an inorganic sunscreen active ingredient ZnO.

## ACKNOWLEDGEMENTS

The authors are grateful to the Directorate General of Strengthening Research and Development, Ministry of Research, Technology and Higher Education of the Republic of Indonesia via the Higher Education Excellent Applied Research (PTUPT 2019, 041/SP2H/LT/MULTI/L7/2019).

## Proceedings

### Proceedings of the 2nd Health Science International Conference

October 5-5, 2019, in Malang, Indonesia

**Editors:** Edi Purwanto ; Siti Rofida ; Indah Dwi Pratiwi ; Risa Herlianita and Angraini Dwi Kurnia

**Affiliation:** University of Muhammadiyah Malang, Indonesia

**ISBN:** 978-989-758-462-6

**Conference Link:** <http://hsic.umm.ac.id/>

**Foreword:** The development of health sciences in the fields of research, education, and clinical practice will always change with new findings. Therefore, it is necessary to have a scientific meeting to disseminate or share information related to the latest research and findings in the health sector. This proceeding contains articles of research results presented at the 2nd Health Science International Conference at the University of Muhammadiyah Malang, Indonesia, on October 5th, 2019. The theme of the conference is "Recent Innovations in Health Practice, Education and Research". In this conference, doctors, nurses, researchers, and academics, postgraduate students who are ready to share their research results and to build networking. The conference also provides opportunities for participants to build networking and share knowledge; therefore, it will enhance the quality of Nursing and Health Care with the latest interventions and innovations. Thank all participants, particularly **(More)**

Indah D. Pratiwi and Edi Purwanto DOI:10.5220/000912500

---

**Audit of Nursing Care Quality at Dr. Slamet Hospital** P. 133 - 136  
Rohmah Susanto , Ati Surya Mediawati and Kurniawan Yudianto DOI:10.5220/000912510

---

**Extract Gel of Chinese Petai Leaf (Leucaenaleucocephala) for Acute Wounds in Rats (Rattusnorvegicus)** P. 137 - 142  
Anis Ika Nur Rohmah , Edi Purwanto and Vicky Nurdiansyah DOI:10.5220/000912570

---

**Formulation and Evaluation Antioxidant Activity of Peel-off Masks from White Pomegranate Extract with Polyvinyl Alcohol and Polyethylene Glycol 1500** P. 143 - 147  
Amaliyah Dina Anggraeni , Dian Ermawati , Raditya Weka Nugraheni and Aditya Anugrah Putri DOI:10.5220/000912580

---

**Economic Loss Analyses Due to Tuberculosis at Kolaka Regency in South-East Sulawesi Province** P. 148 - 151  
La Ode Saafi , La Ode Kamalia and Risal DOI:10.5220/000912590

---

**Phytochemical Screening and Antimicrobial Activity of Limonia acidissima Ethanol Extract Against Microbes from Clinical Isolates** P. 152 - 156  
Ahmad Shobrun Jamil , Siti Rofida , Dian Priyani , Wahidatin Nabila and Evi Wulandari DOI:10.5220/000912600

---

**Design and Development of Peel-off Mask Gel Formulation of Citronella Oil for Acne Vulgaris** P. 157 - 163  
Dyah Rahmasari , Dian Ermawati , Raditya Weka Nugraheni , Dwi Ramadhaningtyas Putri and Indah Nur Pratiwi DOI:10.5220/000912610

---

**Characterization and Antibacterial Activity of Dayak Onion (Eleutherine palmifolia) Hydrogel in Vitro** P. 164 - 170  
Uswatun Chasanah , A. B. Apriliyanto , D. Anggara , Ayu Kusumawardani and Dian Ermawati DOI:10.5220/000912620

---

**Anticancer Activity of Fibraurea Tinctoria with DLD1 Celline Cytotoxicity Assay** P. 171 - 175  
Riski Sulistiarini , Andreanus A. Soemardji , Elfahmi , Maria Immaculata Iwo , Danang Waluyo and Dian Japany Puspitasari DOI:10.5220/000912640

---

**Red Pigmented Natural Extract as Potential Organic UV Filter and Its Use in Combination with ZnO as Sunscreen Cream** P. 176 - 180  
Eva Monica , Leny Yuliati and Yuyun Yuniati DOI:10.5220/000912650

---

**The Effect of Caesalpinia Sappan Linn to Decrease Blood Glucose Level on Diabetes Type II Patients** P. 181 - 186  
Zaqqi Ubaidillah and Yessy Witantry DOI:10.5220/000912660

---

**The Correlation of Work Loads and Work Positions on Risk Occurrence of Myogenic Low Back Pain on Sand Mining** P. 187 - 190  
Safun Rahmanto , Ali Multazam and Anggun Retno Muninggar DOI:10.5220/000912680

---

- 
- Characterization and Prospect of Irradiated Chitosan as Nano Complex Material to Deliver MicroRNA in Cancer Therapy** P. 191 - 196  
Firasti Agung Nugrahening Sumadi , Dian Pribadi Perkasa , Tirta Wardana , Ronny Martien and Sofia Mubarika Harjana **DOI:10.5220/000912700**
- 
- Design of Phosphate Binder Used as Chronic Kidney Disease Therapy at General Hospital Dr. Iskak Tulungagung** P. 197 - 200  
Aghnia Fuadatul Inayah , Khoridatur Rohmah , Didik Hasmono , Lilik Yusetyani and Binti Muzayyanah **DOI:10.5220/000912710**
- 
- Improvement of Knowledge on Iron Deficiency Anemia and Its Prevention among Bustanul Athfal Teachers in Malang** P. 201 - 204  
Diah Hermayanti , Meddy Setiawan and Hawin Nurdiana **DOI:10.5220/000912730**
- 
- Effectivity of the Ankle Weight Exercise to Increasing Football Player's Agility, Speed and Long Passing Power** P. 205 - 208  
Ali Multazam , Sita Nur Annisa Merindayanti , Aqidatul Izza Aisyah , Fajar Dwika Primadana Ajie and Nungki Marlian Yuliadarwati **DOI:10.5220/000912750**
- 
- Effect of Arthrospira maxima Setchell et Gardner and Chlorella vulgaris Beijerinck on Erythrocyte and Thrombocyte Profile of Hyperglycemia Wistar Rats (Rattus norvegicus Berkenhout, 1769)** P. 209 - 219  
Mulyati , Slamet Widiyanto and Lasmini Syariatini **DOI:10.5220/000912760**
-
